RESEARCH INTERESTS	I like to hypothesize about what “basic” models and algorithms the brain may employ to break down and solve the computational problems it faces. For inspiration, I look towards machine learning. For example, generative models offer solutions for how brains may learn patterns that describe data production, and reinforcement learning offers solutions for how an agent can choose actions that maximize its satisfaction in the world. I am also interested in social equity and justice, so I have more high-level interests in exploring why social stereotyping seems to <i>naturally emerge</i> as brains learn to create and generalize category representations for objects.
